

## Lean but not mean

### **The new fixturing system Aluquick (AQ) from Witte Bleckede enables high flexibility with a small number of basic components**

Witte Bleckede, manufacturer of different workpiece clamping systems, presents a new modular fixturing system AQ at the Control in Stuttgart.

It comprises of extruded profiles with grooves but incorporating a grid.

With its cost-effective standard components allowing high repeatability AQ fulfills current demands regarding main characteristics required for fixture building.

AQ fixtures allow repeatably accurate positioning using the grid or positioning off-grid using grooves.

The intentionally limited number of different AQ standard components means start up is possible with low initial investment.

As a result of the compatibility with existing Witte systems such as Alufix Classic, and Alufix XL almost unlimited expansion is possible.

Special connection elements give AQ further advantages for fixture building compared to conventional extruded profiles. The connection technology not only simplifies assembly but also offers the possibility of modifying fixtures without having to disassemble the basic frame.

For large fixtures such as passenger car doors or side panels several bars can be connected, thereby achieving additional rigidity for large, heavy work pieces. AQ profiles are available in prefabricated shorter lengths, but can be supplied up to a length of six meters.

AQ is predestined for fixture building, where the need for economical, rigid and at the same time light fixtures is constantly growing.
